

## Nilotinib

Revised: December 3, 2018.

CASRN: 641571-10-0

## Drug Levels and Effects

### Summary of Use during Lactation

Although the amount of nilotinib in milk appears to be small and one breastfed infants apparently experienced no adverse effects during maternal use of nilotinib, no long-term data are available. Because nilotinib is 98% bound to plasma proteins, the amounts in milk are likely to be low. However, there is little published experience with nilotinib during breastfeeding, and an alternate drug may be preferred, especially while nursing a newborn or preterm infant. The manufacturer recommends that breastfeeding be discontinued during nilotinib therapy and for 14 days after the last dose.

### Drug Levels

*Maternal Levels.* One woman with Ph<sup>+</sup> chronic myelocytic leukemia was taking nilotinib before pregnancy, but stopped until breastfeeding ceased. She received one dose of nilotinib 400 mg orally and took milk samples at 1,

2, 4, 6, 8, 12 and 24 hours after the dose. She had a peak milk concentration of 129 mcg/L at 4 hours after the dose.[1]

*Infant Levels.* Relevant published information was not found as of the revision date.

## Effects in Breastfed Infants

A woman with chronic myeloid leukemia received nilotinib (dosage not stated) for 20 months before pregnancy, throughout pregnancy and continuing during 9 months of breastfeeding (extent not stated). No adverse reactions were reported in her breastfed infant.[2]

## Effects on Lactation and Breastmilk

Relevant published information was not found as of the revision date.

## Alternate Drugs to Consider

Imatinib
