Bismuth Subsalicylate

Revised: October 31, 2018.

CASRN: 14882-18-9

Drug Levels and Effects

Summary of Use during Lactation

Because of the possibility of absorption of salicylate from the breastmilk by the infant, alternatives are preferred. [1]

Drug Levels

Maternal Levels. No published information was found on the use of bismuth subsalicylate during breastfeeding. Infant salicylate intake is estimated to be less than 1% of the maternal dose when both drug and metabolite are considered.[2]

Infant Levels. Relevant published information was not found as of the revision date.

Disclaimer: Information presented in this database is not meant as a substitute for professional judgment. You should consult your healthcare provider for breastfeeding advice related to your particular situation. Effects in Breastfed Infants

One case report of metabolic acidosis was caused by salicylate in a 16-day old breastfed infant whose mother was taking aspirin 650 mg every 4 hours for arthritis.[3] However, there was no measurement of salicylate in maternal serum or milk and it is unclear whether the infant had received any salicylate directly.

Effects on Lactation and Breastmilk

Relevant published information was not found as of the revision date.

Alternate Drugs to Consider

(Diarrhea) Loperamide; (Heartburn) Antacids, Cimetidine, Famotidine, Nizatidine, Omeprazole, Pantoprazole, Ranitidine
