# Chapter 8 Summary <br> Reactions As Collisions 

Recall from before that according to collision theory:

$$
\begin{gathered}
\mathrm{r}_{\mathrm{A}-\mathrm{BC}}=\mathrm{Z}_{\mathrm{ABC}} \mathrm{P}_{\text {reaction }} \\
\text { (Equation } 7.10 \text { ) }
\end{gathered}
$$

Today advanced collision theory: Method

- simulate the collisions
- Integrate using statistical mechanics

$$
\begin{aligned}
& { }^{\mathrm{r}} \mathrm{~A} \rightarrow \mathrm{BC}=\iiint \iiint_{\mathrm{r}} \rightarrow \mathrm{BC}\left(\mathrm{v}_{\mathrm{A}} \rightarrow \mathrm{BC}, \mathrm{E} \mathrm{BC}, \phi, \mathrm{~b} \mathrm{~A} \rightarrow \mathrm{BC}, \mathbb{R}, \mathrm{v} B C\right) \times \\
& \mathrm{D}\left(\mathrm{v} \mathrm{~A} \rightarrow \mathrm{BC} \mathrm{E}_{\mathrm{BC}}, \phi, \mathrm{~b} \mathrm{~A} \rightarrow \mathrm{BC}, \mathbb{R}^{\mathrm{R}} \mathrm{BC}, \mathrm{vBC}\right) \mathrm{dv}_{\mathrm{A}} \rightarrow \mathrm{BC} \mathrm{dE}_{\mathrm{BC}} \mathrm{~d} \mathrm{\phi} \mathrm{db} \mathrm{~A} \rightarrow \mathrm{BCdR} \mathrm{BC} \mathrm{dv}_{\mathrm{BC}} \\
& \text { (Equation 8.20) }
\end{aligned}
$$

Figure 8.2 A typical trajectory for the collision of an $A$ atom with a BC molecule as calculated by the methods in section 8.3.2.

## (Equation 8.23)

${ }^{\mathrm{r}} \mathrm{A} \rightarrow \mathrm{BC}=\mathrm{CACBC} \iiint \iiint_{\text {Preaction }}\left(\mathrm{vA} \rightarrow \mathrm{BC}, \mathrm{EBC}, \mathrm{bA} \rightarrow \mathrm{BC}, \phi, \mathbb{R} \mathrm{BC}, \mathrm{vBC}^{2}\right) \mathrm{v} \mathrm{A} \rightarrow \mathrm{BC} \times$

## (Equation 8.24)

$\mathrm{k}_{2}=\iiint \iiint P_{\text {reaction }}\left(\mathrm{v} \mathrm{A} \rightarrow \mathrm{BC}, \mathrm{EBC}^{\mathrm{B}}, \mathrm{b} \mathrm{A} \rightarrow \mathrm{BC}, \phi, \mathbb{R}^{\mathrm{R}} \mathrm{BC}, \mathrm{vBC}^{\mathrm{B}}\right) \mathrm{v} \mathrm{A} \rightarrow \mathrm{BC} \times$

## (Equation 8.25)

## If we can calculate reaction probabilities can calculate rates

Molecular dynamics as a way of calculating reaction probabilities

## Idea:

- Treat atoms as billiard balls moving in the force field created by all of the other atoms
- Assume molecules start moving toward each other.
- Solve Newton's equation of motion ( $\mathrm{F}=\mathrm{ma}$ ) to calculate the motion of the atoms during the collision
See if reaction occurs

Figure 8.1 A typical collision between A and BC.

## Do simulation

Next set up the background to do the simulation
What do we need to do the simulations?

- Need to know intermolecular forces
- Need to have a way to integrate equation of motion (already have one from chapter 4)

## Intermolecular forces

$\mathrm{F}_{\mathrm{Ne}}=-\frac{\partial \mathrm{V}}{\partial \mathbb{R}^{\mathrm{NeNe}}}$
(Equation 8.34)

Where do these plots come from

Figure 8.3 A neon-neon and a fluorinefluorine potential.

## Types of intermolecular forces:

- Dispersion Forces
- Forces due to Electron Exchange and Bonding
- Pauli Repulsions
- Nuclear Repulsions

## Dispersion forces

Figure 8.4 The interaction between two neon atoms.

## Pauli repulsions:

Figure 8.5 The changes in the homo of $\mathrm{Ne}_{2}$ as the neon atoms move together.

Figure 8.6 The changes in the highest occupied molecular orbital when two fluorines come together.

Figure 8.3 A neon-neon and a fluorinefluorine potential.

## Reactive potentials

$$
\mathrm{A}+\mathrm{BC} \rightarrow \mathrm{AB}+\mathrm{C}
$$

## (Equation 8.37)

$$
\mathrm{Cl}+{ }^{18} \mathrm{~F}-{ }^{19} \mathrm{~F} \rightarrow \mathrm{Cl}{ }^{18} \mathrm{~F}+{ }^{19} \mathrm{~F}
$$

## (Equation 8.39)

Figure 8.7 The changes in the $3 \mathrm{~A}_{\mathrm{lg}}$ orbital when a chlorine approaches a $\mathrm{F}_{2}$.

Figure 7.G. 2 A side view of the potential in figure 7.G.1. Elevation=0, rotation $=90$ perspective $=30$, chart depth $=100$
(Figure 7.G. 2 replaced - Figure 8.9 A potential energy surface for reaction)

Ways to visualize motion

- as a trajectory in space where all the atoms move
- as a trajectory on the potential energy surface in Figure 8.9 where the bond lengths evolve
- as a plot of the motion of the atoms versus time

Figure 8.10 A series of trajectories during the reaction $A+B C \rightarrow A B+C$, with $M_{A}=M_{C}=1$, $\mathrm{M}_{\mathrm{B}}=19$, and various initial reactant configurations.

Figure 8.11 A series of typical trajectories for motion over a potential energy contour.

## Consider exchange reactions

$$
\begin{gathered}
\mathrm{A}+\mathrm{BC} \rightarrow \mathrm{AB}+\mathrm{C} \\
\mathbf{( 8 . 4 5 )} \\
\mathrm{D} \bullet+\mathrm{CH}_{3} \mathrm{CH}_{3} \rightarrow \mathrm{DH}+\bullet \mathrm{CH}_{2} \mathrm{CH}_{3} \\
\mathbf{( 8 . 4 6 )} \\
\mathrm{~F} \bullet+\mathrm{CH}_{3} \mathrm{Cl} \rightarrow \mathrm{FCH}_{3}+\mathrm{Cl} \bullet \\
\mathbf{( 8 . 4 7 )} \\
\mathrm{HO} \bullet+\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{3} \rightarrow \mathrm{HOCH}_{3}+\bullet \mathrm{CH}_{2} \mathrm{CH}_{3} \\
\mathbf{( 8 . 4 8 )}
\end{gathered}
$$

Figure 8.12 An idealized potential energy surface for the reaction $\mathrm{A}+\mathrm{BC} \rightarrow \mathrm{AB}+\mathrm{C}$.

Figure. 1 Two typical trajectories A series of trajectories for the reaction $A+B C \Rightarrow A B+C$, with $\mathrm{M}_{\mathrm{A}}=\mathrm{M}_{\mathrm{C}}=1, \mathrm{M}_{\mathrm{C}}=19, \mathrm{E}_{\text {total }}=18 \mathrm{kcal} / \mathrm{mole}\left(\mathrm{E}_{\text {trans }}=14 \mathrm{kcal} / \mathrm{mole}, \mathrm{E}_{\text {tot }}=0 \mathrm{kcal} / \mathrm{mole}\right.$, $\mathrm{E}_{\mathrm{vib}}=4 \mathrm{kcal} / \mathrm{mole}$. Reaction occurs in the top trajectory but not in the bottom trajectory.

Figure 8.14 A sampling of the trajectories taken by putting a total of $13.8 \mathrm{kcal} / \mathrm{mole}$ into the reactants, choosing random initial positions for the atoms, putting a random amount of rotational energy into the BC bond. Choosing the initial velocity at A toward BC so that the total energy was $13.8 \mathrm{kcal} /$ mole and then integrating the equations of motion to see whether reaction occurs. In this example, the barrier is $13.88 \mathrm{kcal} /$ mole so no reaction occurs.

Figure 8.15 A replot of the data from Figure 8.14 on a potential energy surface.

Figure 8.16 A series of trajectories calculated by fixing the total energy of the reactants and then optimizing all of the other parameters. The barrier is $13.88 \mathrm{kcal} /$ mole for this example.

## If the system has enough energy to make it over the saddle point, reaction can occur!

## Not every collision makes it though.

Figure 8.21 A series of cases where the molecules have enough energy to get over the barrier. Notice that some of the molecules do not make it, because the partitioning the energy between translation and rotation is incorrect.

Figure 8.20 A replot of the results in Figure 8.19 on a potential energy surface.

Figure 8.17 A blow up of the top of the barrier.

Figure 8.18 The cross section for reaction $\mathrm{H}+\mathrm{H}_{2} \rightarrow \mathrm{H}_{2}+\mathrm{H}$. Adapted from Tsukiyariu et. al. [1986] and Levine and Bernstein[1987].

Figure 8.19 A series of cases calculated by fixing free energy at $18 \mathrm{kcal} / \mathrm{mole}$, fixing the vibrational energy at $6 \mathrm{kcal} /$ mole and varying whether A hits when C is vibrating in toward B or out away from B.

Figure 8.20 A replot of the results in Figure 8.19 on a potential energy surface.

Figure 8.21 A series of cases where the molecules have enough energy to get over the barrier. Notice that some of the molecules do not make it, because the partitioning the energy between translation and rotation is incorrect.

## What do we need to get reaction - linear case?

Need enough energy to get over the barrier

Figure 8.16 A series of trajectories calculated by fixing the total energy of the reactants and then optimizing all of the other parameters. The barrier is $13.88 \mathrm{kcal} / \mathrm{mole}$ for this example.

Not every collision makes it though.

Figure 8.20 A replot of the results in Figure 8.19 on a potential energy surface.

## Need sequential motion of the atoms:

Figure 8.20 A series of cases calculated by fixing free energy at $18 \mathrm{kcal} / \mathrm{mole}$, fixing the vibrational energy at $6 \mathrm{kcal} /$ mole and varying whether $A$ hits when $C$ is vibrating in toward $B$ or out away from B.

## Turning analogy

Figure 8.20 A replot of the results in Figure 8.19 on a potential energy surface.

## Also need correct distribution between translation and vibration:

Figure 8.21 A series of cases where the molecules have enough energy to get over the barrier, but they do not make it, unless partitioning the energy between translation and rotation is correct.

## Again turning analogy important

## Polanyi rules:

## Can use vibration/translation to probe structure of transition state:

Figure 8.24 Potential energy surfaces with early, middle and late transition states.

## Leads to excess energy in product:

Figure 8.25 The distribution of vibrational energy produced during the reaction $\mathrm{F}+\mathrm{H}_{2} \rightarrow \mathrm{HF}+\mathrm{H}$. Results of Polayni and Woodall [1972].

## Summary of linear collisions

can treat the collision of two molecules as a collision between two classical particles following Newton's equations of motion.

The reactants have to have enough total energy to get over the transition state (or Col ) in the potential energy surface.

It is not good enough for the molecules to just have enough energy. Rather, the energy needs to be correctly distributed between vibration and transition.

Coordinated motions of the atoms are needed. In particular, it helps to have C moving away from B when A collides with BC.

We also find that we need to localize energy and momentum into the $\mathrm{B}-\mathrm{C}$ bond for reaction to happen.

The detailed shape of the potential energy surface has a large influence on the rate.

These effects mean that the system has very complex behavior. Note, however, that the latter four effects only cause perhaps a factor of 10 or 100 in rate. There are always some trajectories which make it over the barrier, even though the molecules have barely enough energy to cross the barrier. If $1 \%$ of the trajectories make it those trajectories will have an important effect on the rate.

Next: Non- linear case:
Different because reaction probability varies with the impact parameter

Figure 8.27 The typical trajectory for the collision of an A atom with a BC molecule.

Figure 8.26 The variation in $\mathrm{P}_{\mathrm{A} \rightarrow \mathrm{BC}}$ with changing impact parameter.

Extra barrier to non-linear collisions:

- Component of velocity caries reactants apart
- Must overcome that velocity component for reaction to occur

Book derives and equation for the the Angular Momentum Barrier to Reaction

The derivation starts by looking at the classical equations of motion of A and B .

$$
\begin{equation*}
\mathrm{m}_{\mathrm{A}} \frac{\mathrm{~d}^{2} \mathbb{R}_{\mathrm{A}}}{\mathrm{dt}^{2}}=\overrightarrow{\mathrm{F}}_{\mathrm{A}}=-\nabla_{\mathrm{A}} \mathrm{~V}\left(\mathbb{R}_{\mathrm{A}}, \mathbb{R}_{\mathrm{B}}\right) \tag{8.81}
\end{equation*}
$$

Pages of Algebra

$$
\begin{gathered}
E=\frac{1}{2} \mu_{A B}\left(\frac{d \mathbb{R}_{A B}}{d t}\right)^{2}+\left[\frac{E_{A B} b^{2}}{\mathbb{R}_{A B}^{2}}+V\left(\mathbb{R}_{A B}\right)\right] \\
\mathbf{( 8 . 1 3 0 )}
\end{gathered}
$$

# It is useful to define an effective potential, $\mathrm{V}_{\text {eff }}$, by: 

## Result: atom moves in effective potential:

$$
V_{\mathrm{eff}}\left(\mathbb{R}_{\mathrm{AB}}\right)=\frac{\mathrm{E}_{\mathrm{AB}} \mathrm{~b}^{2}}{\mathbb{R}_{\mathrm{AB}}^{2}}+\mathrm{V}\left(\mathbb{R}_{\mathrm{AB}}\right)
$$

## (8.131)

Figure 8.28 A plot of the effective potential as a function of $\mathbb{R}_{A B}$ for a modified Lennard Jones Potential with $\mathrm{b}_{\mathrm{A} \rightarrow \mathrm{BC}}=0,1,2,3,4,5,6$.

# The angular momentum barrier prevents reactions from occurring when molecules approach with large impact parameters. As a result, no reaction occurs unless the reactants get close to each other. 

Figure 8.26 The variation in $\mathrm{P}_{\mathrm{A} \rightarrow \mathrm{BC}}$ with changing impact parameter.

## Quantifying the effects:

Let's define $P_{\text {reaction }}$ as the probability that a given $A$ molecule reacts with a given $B C$ molecule if the two molecules collide. One can show that the reaction probability varies with:

- $\mathrm{v}_{\mathrm{A} \rightarrow \mathrm{BC}}$, the velocity that the A molecule approaches the BC molecule;
- $\mathrm{E}_{\mathrm{BC}}$, the internal state (i.e., vibrational, rotational energy) of the BC molecule before collision occurs;
- the "impact parameter" $\mathrm{b}_{\mathrm{A} \rightarrow \mathrm{BC}}$, which is a measure of how closely A collides with BC;
- "the angle of approach" where $\phi$ is a measure of the angle of the collision
- the initial position $\mathbb{R}_{B C}$ and velocity $\mathrm{v}_{\mathrm{BC}}$ of B relative to C when collision occurs.

$$
\begin{aligned}
& \frac{1}{\mu_{\mathrm{AB}}}=\frac{1}{\mathrm{M}_{\mathrm{A}}}+\frac{1}{\mathrm{M}_{\mathrm{B}}} \\
&(8.57)
\end{aligned}
$$

$$
\begin{aligned}
\sigma_{\mathrm{A} \rightarrow \mathrm{BC}}\left(\mathrm{v}_{\mathrm{A} \rightarrow \mathrm{BC}}, \mathrm{E}_{\mathrm{BC}}\right)=\iiint \int \mathrm{P}_{\text {reaction }}\left(\mathrm{v}_{\mathrm{A} \rightarrow \mathrm{BC}}, \mathrm{E}_{\mathrm{BC}}, \mathrm{~b}_{\mathrm{A} \rightarrow \mathrm{BC}}, \phi, \mathbb{R}_{\mathrm{BC}}, \mathrm{v}_{\mathrm{BC}}\right) \times \\
\mathrm{D}_{1}\left(\mathbb{R}_{\mathrm{BC}}, \mathrm{v}_{\mathrm{BC}}\right) \mathrm{b}_{\mathrm{A} \rightarrow \mathrm{BC}}, \mathrm{db}_{\mathrm{A} \rightarrow \mathrm{BC}} \mathrm{~d} \mathrm{\phi dR}^{B C}{ }^{\mathrm{dv}} \mathrm{BC} \\
(8.58)
\end{aligned}
$$

$$
\sigma_{\mathrm{A} \rightarrow \mathrm{BC}}^{\mathrm{r}}\left(\mathrm{v}_{\mathrm{A} \rightarrow \mathrm{BC}}, \mathrm{E}_{\mathrm{BC}}\right)=2 \pi \int \mathrm{P}_{\mathrm{A} \rightarrow \mathrm{BC}}\left(\mathrm{~b}_{\mathrm{A} \rightarrow \mathrm{BC}}, \mathrm{v}_{\mathrm{A} \rightarrow \mathrm{BC}}, \mathrm{E}_{\mathrm{BC}}\right) \mathrm{b}_{\mathrm{A} \rightarrow \mathrm{BC}} \mathrm{db}_{\mathrm{A} \rightarrow \mathrm{BC}}
$$

(8.59)

## Example 8.E Calculating the Cross Section

A program called ReactMD is available from Dr. Masel's website. Assume you used the program to calculate the reaction probability as a function of impact parameter, and the data in Table 8.E. 1 were obtained. Calculate the cross section for the reaction.

| Table 8.E.1 |  |  |  |
| :---: | :---: | :---: | :---: |
| $\mathrm{b}_{\mathrm{A} \rightarrow \mathrm{BC},}, \AA$ | $\mathrm{P}(\mathrm{b})$ | $\mathrm{b}_{\mathrm{A} \rightarrow \mathrm{BC},}, \AA$ | $\mathrm{P}(\mathrm{b})$ |
| 0 | .84 | 1.2 | .80 |
| .2 | .83 | 1.4 | .83 |
| .4 | .85 | 1.6 | .72 |
| .6 | .78 | 1.8 | .21 |
| .8 | .80 | 2.0 | .10 |
| 1.0 | .75 | 2.2 | 0 |

Solution: The cross section is given by:

$$
\sigma=2 \pi \int_{0}^{\infty} \mathrm{P}(\mathrm{~b}) \mathrm{bdb}
$$

We can integrate using the trapezoid rule.

## Here is a spreadsheet to do the calculations:

|  | A | B | C |
| :--- | :--- | :--- | :--- |
| 03 | b | $\mathrm{P}(\mathrm{b})$ |  |
| 04 | 0 | 0.84 | $=\mathrm{A} 4 * \mathrm{~B} 4$ |
| 05 | 0.2 | 0.83 | $=\mathrm{A} 5 * \mathrm{~B} 5$ |
| 06 | 0.4 | 0.85 | $=\mathrm{A} 6 * \mathrm{~B} 6$ |
| 07 | 0.6 | 0.78 | $=\mathrm{A} 7 * \mathrm{~B} 7$ |
| 08 | 0.8 | 0.8 | $=\mathrm{A} 8^{*} 88$ |
| 09 | 1 | 0.75 | $=\mathrm{A} 9 * \mathrm{~B} 9$ |
| 10 | 1.2 | 0.8 | $=\mathrm{A} 10 * \mathrm{~B} 10$ |
| 11 | 1.4 | 0.83 | $=\mathrm{A} 11 * \mathrm{~B} 11$ |
| 12 | 1.6 | 0.72 | $=\mathrm{A} 12 * \mathrm{~B} 12$ |
| 13 | 1.8 | 0.21 | $=\mathrm{A} 13 * \mathrm{~B} 13$ |
| 14 | 2 | 0.1 | $=\mathrm{A} 14 * \mathrm{~B} 14$ |
| 15 | 2.2 | 0 | $=\mathrm{A} 15 * \mathrm{~B} 15$ |
| 16 |  |  |  |
| 17 |  | integral $=$ | $=0.5 *(\mathrm{C} 4+\mathrm{C} 15)+\mathrm{SUM}(\mathrm{C} 5: \mathrm{C} 14)$ |
| 18 |  | $\sigma=$ | $=2 * \mathrm{PI}()^{* \mathrm{C} 17}$ |

## Here are the results:

|  | A | B | C |
| :--- | :--- | :--- | :--- |
| 03 | b | $\mathrm{P}(\mathrm{b})$ |  |
| 04 | 0 | 0.84 | 0 |
| 05 | 0.2 | 0.83 | 0.166 |
| 06 | 0.4 | 0.85 | 0.34 |
| 07 | 0.6 | 0.78 | 0.468 |
| 08 | 0.8 | 0.8 | 0.64 |
| 07 | 1 | 0.75 | 0.75 |
| 10 | 1.2 | 0.8 | 0.96 |
| 11 | 1.4 | 0.83 | 1.162 |
| 12 | 1.6 | 0.72 | 1.152 |
| 13 | 1.8 | 0.21 | 0.378 |
| 14 | 2 | 0.1 | 0.2 |
| 15 | 2.2 | 0 | 0 |
| 16 |  |  |  |
| 17 |  | integral $=$ | 6.216 |
| 18 |  | $\sigma=$ | 39.05628 |

## Example 8.D: Calculating the rate constant using equation 8.60

Figure 8.17 shows some data for the cross section for the reaction $\mathrm{H}+\mathrm{H}_{2} \rightarrow \mathrm{H}_{2}+\mathrm{H}$ as a function of $\mathrm{E}_{\mathrm{T}}$, the translational energy of H approaching $\mathrm{H}_{2}$. The energy is measured in center of mass coordinates as described in section 8.9.

Assume that the cross section follow:

$$
\begin{aligned}
& \sigma_{\mathrm{A} \rightarrow \mathrm{BC}}^{\mathrm{r}}>0 \text { for } \mathrm{E}_{\mathrm{T}} \leq 0.35 \mathrm{eV} \\
& \sigma_{\mathrm{A} \rightarrow \mathrm{BC}}^{\mathrm{r}}=12(\AA)^{2}\left(1-\exp \left(0.35 \mathrm{eV}-\mathrm{E}_{\mathrm{T}}\right) /(5.08 \mathrm{eV})\right) \times \\
& \exp \left(-\mathrm{E}_{\mathrm{T}} / 2 \mathrm{eV}\right) \quad \text { for } \mathrm{E}_{\mathrm{T}} \geq 0.35 \mathrm{eV}
\end{aligned}
$$

(8.D.2)
where $\mathrm{E}_{\mathrm{T}}$ is the translational energy. Calculate the rate constant for the reaction at 300 K .

According to equation 8.60, if there is no $\mathrm{E}_{\mathrm{BC}}$ dependence

$$
\mathrm{k}_{\mathrm{A} \rightarrow \mathrm{BC}}=\int_{0}^{=} \mathrm{v}_{\mathrm{A} \rightarrow \mathrm{BC}} \sigma_{\mathrm{A} \rightarrow \mathrm{~B}}^{r} \mathrm{D}\left(\mathrm{v}_{\mathrm{A}-\mathrm{BC}}\right) \mathrm{d} \mathrm{v}_{\mathrm{A} \rightarrow \mathrm{BC}}
$$

According to results in Example 6.2:

$$
\mathrm{D}\left(\mathrm{v}_{\mathrm{A} \rightarrow \mathrm{BC}}\right)=\frac{\left(\mathrm{v}_{\mathrm{A} \rightarrow \mathrm{BC}}\right)^{2} \exp \left(-\frac{\mu_{\mathrm{ABC}}}{2 \mathrm{k}_{\mathrm{B}} \mathrm{~T}}\left(\mathrm{v}_{\mathrm{A} \rightarrow \mathrm{BC}}\right)^{2}\right)}{\int_{0}^{\infty}\left(\mathrm{v}_{\mathrm{A} \rightarrow \mathrm{BC}}\right)^{2} \exp \left(-\frac{\mu_{\mathrm{ABC}}}{2}\left(\mathrm{v}_{\mathrm{A} \rightarrow \mathrm{BC}}\right)^{2}\right)}
$$

(8.D.4)
where $\mu_{\mathrm{ABC}}$ is the reduced mass of $\mathrm{ABC}, \mathrm{k}_{\mathrm{B}}$ is Boltzman's constant and T is the temperature. Looking up the integral in the CRC yields:

$$
\mathrm{D}\left(\mathrm{v}_{\mathrm{A} \rightarrow \mathrm{BC}}\right)=\frac{4}{\sqrt{\pi}}\left(\frac{\mu_{\mathrm{ABC}}}{2 \mathrm{k}_{\mathrm{B}} \mathrm{~T}}\right)^{3 / 2}\left(\mathrm{v}_{\mathrm{A} \rightarrow \mathrm{BC}}\right)^{2} \exp \left(-\frac{\mu_{\mathrm{ABC}}}{2 \mathrm{k}_{\mathrm{B}} \mathrm{~T}}\left(\mathrm{v}_{\mathrm{A} \rightarrow \mathrm{BC}}\right)^{2}\right)
$$

(8.D.5)

Combining equations (8.D.3) and 8.D.5) and substituting $\mathrm{E}_{\mathrm{T}}=\frac{1}{2} \mu_{\mathrm{ABC}}\left(\mathrm{v}_{\mathrm{A} \rightarrow \mathrm{BC}}\right)^{2}$ yields:
$\mathrm{k}_{\mathrm{A} \rightarrow \mathrm{BC}}=\sqrt{\frac{8 \mathrm{k}_{\mathrm{B}} \mathrm{T}}{\pi \mu_{\mathrm{AB}}}} \int_{0}^{\infty}\left(\mathrm{E}_{\mathrm{T}} / \mathrm{k}_{\mathrm{B}} \mathrm{T}\right) \sigma^{\mathrm{r}}{ }_{\mathrm{A} \rightarrow \mathrm{BC}} \exp \left(-\mathrm{E}_{\mathrm{T}} / \mathrm{k}_{\mathrm{B}} \mathrm{T}\right) \mathrm{d}\left(\mathrm{E}_{\mathrm{T}} / \mathrm{k}_{\mathrm{B}} \mathrm{T}\right)$ (8.D.6)

Note:

$$
\begin{equation*}
\sqrt{\frac{8 \hat{k}_{\mathrm{B}} \mathrm{~T}}{\pi \mu_{\mathrm{AB}}}}=\overline{\mathrm{v}}_{\mathrm{A} \rightarrow \mathrm{BC}} \tag{8.D.7}
\end{equation*}
$$

Therefore,
$\mathrm{k}_{\mathrm{A} \rightarrow \mathrm{BC}}=\overline{\mathrm{v}}_{\mathrm{A} \rightarrow \mathrm{BC}}!_{0}^{\infty}\left(\mathrm{E}_{\mathrm{T}} / \mathrm{k}_{\mathrm{B}} \mathrm{T}\right) \sigma_{\mathrm{A} \rightarrow \mathrm{BC}}^{\mathrm{r}} \exp \left(-\mathrm{E}_{\mathrm{T}} / \mathrm{k}_{\mathrm{B}} \mathrm{T}\right) \mathrm{d}\left(\mathrm{E}_{\mathrm{T}} / \mathrm{k}_{\mathrm{B}} \mathrm{T}\right)$
(8.D.8)

For future reference, it is useful to define an average cross section, $\mathrm{I}_{\mathrm{A} \rightarrow \mathrm{BC}}$ by

$$
\begin{gathered}
\mathrm{I}_{\mathrm{A} \rightarrow \mathrm{BC}}=\int_{0}^{\infty}\left(\mathrm{E}_{\mathrm{T}} / \mathrm{k}_{\mathrm{B}} \mathrm{~T}\right) \sigma_{\mathrm{A} \rightarrow \mathrm{BC}}^{\mathrm{r}} \exp \left(-\mathrm{E}_{\mathrm{T}} / \mathrm{k}_{\mathrm{B}} \mathrm{~T}\right) \mathrm{d}\left(\mathrm{E}_{\mathrm{T}} / \mathrm{k}_{\mathrm{B}} \mathrm{~T}\right) \\
(8 . \mathrm{D} .9)
\end{gathered}
$$

Equation 8.D. 8 becomes:

$$
\begin{equation*}
\mathrm{k}_{\mathrm{A} \rightarrow \mathrm{BC}}=\overline{\mathrm{v}}_{\mathrm{A} \rightarrow \mathrm{BC}} \mathrm{I}_{\mathrm{A} \rightarrow \mathrm{BC}} \tag{8.D.10}
\end{equation*}
$$

Let's define a new variable W by:

$$
\begin{equation*}
\mathrm{W}=\left(\mathrm{E}_{\mathrm{T}}-0.35 \mathrm{eV}\right) / \mathrm{k}_{\mathrm{B}} \mathrm{~T} \tag{8.D.11}
\end{equation*}
$$

Substituting equation (8.D.6) into equation (8.D.5) yields:

$$
\begin{aligned}
& \mathrm{k}_{\mathrm{A} \rightarrow \mathrm{BC}}=\overline{\mathrm{v}}_{\mathrm{A} \rightarrow \mathrm{BC}} \mathrm{e}^{-0.35 \mathrm{eV} / \mathrm{k}_{\mathrm{B}} \mathrm{~T}} \times \\
& \int_{-0.35 \mathrm{eV} / \mathrm{k}_{\mathrm{B}} \mathrm{~T}}^{\infty}\left(\mathrm{W}_{\mathrm{k}_{\mathrm{B}} \mathrm{~T}}+0.35 \mathrm{eV} /{\underset{\beta}{\mathrm{B}}}^{\mathrm{T}}\right) \sigma^{\mathrm{r}} \mathrm{~A} \rightarrow \mathrm{BC} \exp (-\mathrm{W}) \mathrm{dW} \\
& \quad(8 . \mathrm{D} .12)
\end{aligned}
$$

For future reference, it is useful to note:
$\mathrm{k}_{\mathrm{B}} \mathrm{T}=0.6 \mathrm{kcal} /$ mole $=0.026 \mathrm{eV} /$ molecule (8.D.13)
$\frac{1}{\mu_{\mathrm{ABC}}}=\frac{1}{2 \mathrm{AMU} / \mathrm{mole}}+\frac{1}{1 \mathrm{AMU} / \mathrm{mole}}=\frac{1.5}{\mathrm{AMU}}$

## (8.D.14)

According to equation (7.A.4):

$$
\begin{gathered}
\overline{\mathrm{v}}_{\mathrm{A} \rightarrow \mathrm{BC}}=\left(2.4 \times 10^{13} \AA / \mathrm{sec}\right)\left(\frac{\mathrm{T}}{300 \mathrm{~K}}\right)^{1 / 2}\left(\frac{1 \mathrm{AMU}}{\mu}\right)^{1 / 2} \\
=\left(2.4 \times 10^{13} \AA / \mathrm{sec}\right)\left(\frac{300 \mathrm{~K}}{300 \mathrm{~K}}\right)^{1 / 2}\left(\frac{1 \mathrm{AMU}}{1 \mathrm{AMU} / 1.5}\right)^{1 / 2} \\
(8 . \mathrm{D} .15)
\end{gathered}
$$

$$
=2.94 \times 10^{13} \AA / \mathrm{sec}
$$

Substituting equation 8.D. 10 into 8.D. 8 and adding the appropriate conversion factors yields:

$$
\begin{gathered}
\mathrm{k}_{\mathrm{A} \rightarrow \mathrm{BC}}=2.94 \times 10^{13} \AA / \sec \exp \left(-0.35 \mathrm{eV} / \mathrm{k}_{\mathrm{B}} \mathrm{~T}\right) \\
\int_{-0.35 \mathrm{eV} / \mathrm{k}_{\mathrm{B}} \mathrm{~T}}^{\infty}\left(\mathrm{W}+0.35 \mathrm{eV} / \mathrm{k}_{\mathrm{B}} \mathrm{~T}\right) \sigma^{\mathrm{r}} \mathrm{~A} \rightarrow \mathrm{BC} \exp (-\mathrm{W}) \mathrm{dW} \\
(8 . \mathrm{D} .16)
\end{gathered}
$$

Note: $\sigma=0$ for $\mathrm{E}_{\mathrm{T}}<0.35 \mathrm{eV}$.

## Therefore,

$$
\begin{gathered}
\mathrm{k}_{\mathrm{A} \rightarrow \mathrm{BC}}=\frac{2.94 \times 10^{13} \AA}{\text { molecule }-\sec } \exp \left(-0.35 \mathrm{eV} / \mathrm{k}_{\mathrm{B}} \mathrm{~T}\right) \times \\
\int_{-0 .}^{\infty}\left(\mathrm{W}+0.35 \mathrm{eV} / \mathrm{k}_{\mathrm{B}} \mathrm{~T}\right) \sigma^{\mathrm{r}} \mathrm{~A} \rightarrow \mathrm{BC} \exp (-\mathrm{W}) \mathrm{dW} \\
(8 . \mathrm{D} .17)
\end{gathered}
$$

Let's define $\mathrm{I}_{\mathrm{A} \rightarrow \mathrm{BC}}$ and $\mathrm{F}(\mathrm{W})$ by:

$$
\begin{gathered}
\mathrm{I}_{\mathrm{A} \rightarrow \mathrm{BC}}=\int_{{ }_{0 .}^{\infty}\left(\mathrm{W}+0.35 \mathrm{eV} / \mathrm{k}_{\mathrm{B}} \mathrm{~T}\right) \sigma^{\mathrm{r}} \mathrm{~A} \rightarrow \mathrm{BC} \exp (-\mathrm{W}) \mathrm{dW}} \\
\text { (8.D.18) } \\
\mathrm{F}(\mathrm{~W})=\left(\mathrm{W}+0.35 \mathrm{eV} / \mathrm{k}_{\mathrm{B}} \mathrm{~T}\right) \sigma_{\mathrm{A} \rightarrow \mathrm{BC}}^{\mathrm{r}} \\
\text { (8.D.19) }
\end{gathered}
$$

Combining equations (8.D.16) and 8.D.17) yields:

$$
\begin{aligned}
\mathrm{I}_{\mathrm{A} \rightarrow \mathrm{BC}}= & \int_{\mathrm{O} .}^{\infty} \mathrm{F}(\mathrm{~W}) \exp (-\mathrm{W}) \mathrm{dW} \\
& \text { (8.D.20) }
\end{aligned}
$$

One can conveniently integrate equation 8.D. 18 using the Laguere integration formula:

$$
\int_{0 .}^{\infty} \mathrm{F}(\mathrm{~W}) \exp (-\mathrm{W}) \mathrm{dW}=\sum_{\mathrm{i}} \mathrm{~B}_{\mathrm{i}} \mathrm{~F}\left(\mathrm{~W}_{\mathrm{i}}\right)
$$

(8.D.21)
where the $\mathrm{B}_{\mathrm{i}}$ and $\mathrm{W}_{\mathrm{i}}$ 's are given in the spreadsheet below.

## Here is a spreadsheet for the calculations:

|  | A | B | C | D | E | F |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 02 | kbT= | $=\mathrm{D}_{2} * 0.00198 / 23.05$ | T= | 300 |  |  |
| 03 |  |  |  |  | $\mathrm{I}=$ | =SUM(F5:F10) |
| 04 | W | Et | S | F(w) | $\mathrm{B}_{\mathrm{i}}$ | term in sum |
| 05 | 0.22285 | $=\mathrm{A} 5 * \mathrm{kbT}+0.35$ | $\begin{aligned} & =12 *(1-\mathrm{EXP}((0.35- \\ & \text { \$B5)/5.08) }) * E X P(-\$ B 5 / 2) \end{aligned}$ | $=\$ \mathrm{~B} 5 * \$ \mathrm{C} / \mathrm{kbt}$ | 0.458964 | =D5*E5 |
| 06 | 1.118893 | $=\mathrm{A} 6 * \mathrm{kbT}+0.35$ | $\begin{aligned} & =12 *(1-\mathrm{EXP}((0.35- \\ & \text { \$B6)/5.08) }) * E X P(-\$ B 6 / 2) \end{aligned}$ | =\$B6*\$C6/kbt | 0.417 | =D6*E6 |

| 08 | 5.77514 | $=\mathrm{A} 8 * \mathrm{kbT}+0.35$ | $\begin{aligned} & =12 *(1-\mathrm{EXP}((0.35- \\ & \text { \$B8)/5.08) }) * E X P(-\$ \mathrm{~B} 8 / 2) \end{aligned}$ | $=\$ \mathrm{~B} 8 * \$ \mathrm{C} / \mathrm{kbt}$ | 0.0103991 | =D8*E8 |
| 09 | 9.83747 | = A9*kbT +0.35 | $\begin{aligned} & =12 *(1-\mathrm{EXP}((0.35- \\ & \text { \$B9)/5.08) }) * E X P(-\$ B 9 / 2) \end{aligned}$ | $=\$ \mathrm{~B} 9 * \$ \mathrm{C} 9 / \mathrm{kbt}$ | 0.000261017 | =D9*E9 |
| 10 | 15.98287 | $=\mathrm{A} 10 * \mathrm{kbT}+0.35$ | $\begin{aligned} & =12 *(1-\mathrm{EXP}((0.35- \\ & \$ \mathrm{~B} 10) / 5.08))^{*} \mathrm{EXP}(- \\ & \$ \mathrm{~B} 10 / 2) \end{aligned}$ | $=\$ \mathrm{~B} 10 * \$ \mathrm{C} 10 / \mathrm{kbt}$ | 8.98547e-7 | =D10*E10 |

## Here are the results:

|  | A | B | C | D | E | F |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 02 | $\mathrm{kbT}=$ | 0.02577 | $\mathrm{~T}=$ | 300 |  |  |
| 03 |  |  |  |  | $\mathrm{I}=$ | 0.747826 |
| 04 | W | Et | s | $\mathrm{F}(\mathrm{w})$ | Bi | term in sum |
| 05 | 0.22285 | 0.355743 | 0.011349 | 0.156665 | 0.458964 | 0.071904 |
| 06 | 1.118893 | 0.378834 | 0.056199 | 0.826153 | 0.417 | 0.34506 |
| 07 | 2.99273 | 0.427123 | 0.146036 | 2.420454 | 0.113373 | 0.274414 |
| 08 | 5.77514 | 0.498826 | 0.26998 | 5.225937 | 0.010399 | 0.054345 |
| 09 | 9.83747 | 0.603512 | 0.43199 | 10.11683 | $2.61 \mathrm{E}-04$ | 0.002641 |
| 10 | 15.98287 | 0.76188 | 0.6385 | 18.87694 | $8.99 \mathrm{E}-07$ | $1.7 \mathrm{E}-5$ |

## Therefore,

$$
\begin{equation*}
\mathrm{I}_{\mathrm{A} \rightarrow \mathrm{BC}}=0.748 \AA^{2} \tag{8.D.23}
\end{equation*}
$$

$$
\begin{gathered}
\mathrm{k}_{\mathrm{A} \rightarrow \mathrm{BC}}=2.94 \times 10^{13} \frac{\AA}{\sec } \times\left(0.748 \AA^{2}\right) \exp \left(-0.35 \mathrm{eV} / \mathrm{k}_{\mathrm{B}} \mathrm{~T}\right) \\
\text { (8.D.24) }
\end{gathered}
$$

$$
\mathrm{k}_{\mathrm{A} \rightarrow \mathrm{BC}}=2.2 \times 10^{13} \frac{(\AA)^{3}}{\begin{array}{c}
\text { molecule }-\sec \\
(8 . \mathrm{D} .25)
\end{array} \exp \left(-0.35 \mathrm{eV} / \mathrm{k}_{\mathrm{B}} \mathrm{~T}\right)}
$$

Notice that the activation barrier is about 0.35 eV (i.e., the minimum energy to get reaction) even though the reaction probability is small below 0.5 eV . It is not exactly 0.35 eV though.

In the problem set, we ask the reader to calculate the rate constant at other temperatures.
$\bar{v}_{A \rightarrow B C}$ and $I_{A \rightarrow B C}$ are temperature dependent. If you make an Arrhenius plot of the data, you find that the activation barrier is not exactly 0.35 eV , but close to 0.35 eV , even though the reaction probability is negligible at $\mathrm{E}=0.35 \mathrm{eV}$.

Discussion Problem:

The reaction probability $\mathrm{A}+\mathrm{BC} \rightarrow \mathrm{AB}+\mathrm{C}$ is given below. Calculate the cross section.

| $\mathbf{b}, \AA$ | $\mathbf{P}(\mathbf{b})$ |
| :---: | :---: |
| 0 | 0.95 |
| 0.25 | 0.93 |
| 0.5 | 0.92 |
| 1.0 | 0.91 |
| 1.5 | 0.50 |
| 2.0 | 0.0 |
