<b>PREFACE</b>	<b>xxi</b>
<b>LIST OF TABLES</b>	<b>xxvii</b>
<b>Introduction</b>	<b>1</b>
<b>SECTION I STRUCTURE OF MATERIALS</b>	
<b>W1 Structure of Crystals</b>	<b>3</b>
W1.1 Crystal Structures Based on Icosahedral Bonding Units	3
W1.2 Packing Fractions of BCC and CsCl Crystal Structures	3
W1.3 Density of CsCl	5
Problem	5
<i>Topics in the Textbook</i>	
1.1 Introduction	
Introduction to Lattices	
1.2 Translation Vectors	
1.3 Unit Cells	
1.4 Bravais Lattices	
1.5 Lattice Axes, Planes, and Directions	
Local Atomic Bonding Units and Crystal Structures	
1.6 Local Atomic Bonding Units	
1.7 Crystal Structures	
1.8 Packing Fractions and Densities	
References	
Problems	
<b>W2 Bonding in Solids</b>	<b>7</b>
W2.1 Atomic, Hybrid, and Molecular Orbitals Involved in Bonding in Solid-State Materials	7
W2.2 Absence of Covalent Bonding in White Sn ( $\beta$ -Sn) and Pb	17
W2.3 Madelung Energy of Ionic Crystals	17
W2.4 Hydrogen Bonding in Ice (Solid H <sub>2</sub> O)	18
W2.5 Standard Enthalpies of Formation	19
W2.6 Bond Energies	20
W2.7 Ionization Energies and Electron Affinities	20
W2.8 Valence	22
W2.9 Electronegativity	23
	<b>vii</b>

W2.10 Atomic Radii	24
References	26
Problems	26
<i>Topics in the Textbook</i>	
2.1 Introduction	
Bonding in Elemental Solids	
2.2 Covalent Bonding	
2.3 Metallic Bonding	
2.4 van der Waals Bonding	
Bonding in Multielement Crystals	
2.5 Ionic Bonding	
2.6 Mixed Ionic–Covalent Bonding and Ionicity	
2.7 Hydrogen Bonding	
Cohesive Energies	
Summary of Some Atomic Properties and Parameters	
2.8 Ionization Energy and Electron Affinity	
2.9 Electronegativity	
2.10 Atomic Radii: Ionic, Covalent, Metallic, and van der Waals	
References	
Problems	
<b>W3 Diffraction and the Reciprocal Lattice</b>	<b>27</b>
W3.1 Voronoi Polyhedra	27
W3.2 Molecular Geometry and Basis Structure from Diffraction Data	27
Reference	30
Problem	30
<i>Topics in the Textbook</i>	
Diffraction	
3.1 Fourier Analysis in One and Three Dimensions	
3.2 Examples of Reciprocal Lattices	
Elastic Scattering from Ordered and Disordered Materials	
3.3 Crystalline Solids	
3.4 Bragg and von Laue Descriptions of Diffraction	
3.5 Polycrystalline Solids or Powders	
3.6 Elastic Scattering from an Amorphous Solid	
References	
Problems	
<b>W4 Order and Disorder in Solids</b>	<b>31</b>
W4.1 Further Discussion of the Random Close-Packing Model	31
W4.2 Further Discussion of the Continuous Random Network Model	32
W4.3 Illustrations of the Law of Mass Action	33
W4.4 Nonstoichiometry	34

Reference	34
<i>Topics in the Textbook</i>	
4.1 Introduction	
Order and Disorder	
4.2 Examples of Ordered and Disordered Solids	
4.3 Amorphous Solids	
Defects in Solids	
4.4 Localized Defects	
4.5 Extended Defects	
4.6 Thermodynamics of Defect Formation: Entropy	
4.7 Examples of Defect Studies	
References	
Problems	

## SECTION II PHYSICAL PROPERTIES OF MATERIALS

<b>W5 Phonons</b>	<b>35</b>
W5.1 Monatomic Lattice with Random Interactions	35
W5.2 Debye–Waller Factor	36
Appendix W5A: Quantization of Elastic Waves	38
Appendix W5B: Dispersion Relations in the General Case	41
Appendix W5C: Van Hove Singularities	42
<i>Topics in the Textbook</i>	
Excitations of the Lattice: Phonons	
5.1 One-Dimensional Monatomic Lattice	
5.2 One-Dimensional Diatomic Lattice	
5.3 Phonons: General Case	
5.4 Phonon Density of States	
Lattice Specific Heat of Solids	
5.5 Specific Heat of Solids	
5.6 Debye Theory of Specific Heat	
5.7 Einstein Theory of Specific Heat	
5.8 Debye–Waller Factor	
Anharmonic Effects	
5.9 Thermal Expansion	
5.10 Thermal Conductivity	
References	
Problems	
<b>W6 Thermally Activated Processes, Phase Diagrams, and Phase Transitions</b>	<b>45</b>
W6.1 Concentration Profiles Resulting from Diffusion	45
W6.2 Examples of Diffusion Studies	48

W6.3 Examples of Vaporization Studies	52
W6.4 Gibbs Phase Rule	53
Problems	53
<i>Topics in the Textbook</i>	
6.1 Introduction	
Thermally Activated Processes	
6.2 Diffusion	
6.3 Vaporization	
Equilibrium Phase Diagrams	
6.4 Pure Substances	
6.5 Binary Systems	
Structural Phase Transitions	
6.6 Melting	
6.7 Solid-State Phase Transitions	
References	
Problems	
<b>W7 Electrons in Solids: Electrical and Thermal Properties</b>	<b>55</b>
W7.1 Boltzmann Equation	55
W7.2 Random Tight-Binding Approximation	56
W7.3 Kronig–Penney Model	57
W7.4 Hall Effect in Band Theory	59
W7.5 Localization	60
W7.6 Properties of Carbon Nanotubes	63
Appendix W7A: Evaluation of Fermi Integrals	64
<i>Topics in the Textbook</i>	
7.1 Introduction	
Classical Theory of Electrical Conduction	
7.2 Drude Theory	
7.3 Hall Effect in Metals	
Free-Electron Gases	
7.4 Sommerfeld Theory	
Transport Theory	
7.5 Onsager Relations	
The Quantum Theory of Solids	
7.6 Bloch’s Theorem	
7.7 Nearly Free Electron Approximation	
7.8 Tight-Binding Approximation in One Dimension	
7.9 Tight-Binding Approximation in Two Dimensions	
7.10 Metals, Insulators, Semiconductors, and Semimetals	
Quantum Effects in Electrical Conduction	
7.11 Temperature Dependence of Resistivity in Metals	
7.12 Semiconductors	

7.13	Magnetoresistance	
	Conduction in Insulators	
7.14	Variable-Range Hopping	
7.15	Poole–Frenkel Effect	
	Metal–Insulator Transition	
7.16	Percolation	
7.17	Mott Metal–Insulator Transition	
	Conductivity of Reduced-Dimensional Systems	
7.18	Carbon Nanotubes	
7.19	Landauer Theory of Conduction	
	References	
	Problems	
<b>W8</b>	<b>Optical Properties of Materials</b>	<b>67</b>
W8.1	Index Ellipsoid and Phase Matching	67
W8.2	Polaritons	70
Appendix W8A:	Maxwell’s Equations	71
Appendix W8B:	Nonlocal Dielectric Function	72
Appendix W8C:	Quantum-Mechanical Derivation of the Dielectric Function	73
	<i>Topics in the Textbook</i>	
8.1	Introduction	
8.2	The Electromagnetic Spectrum	
8.3	AC Conductivity of Metals	
8.4	Reflectivity	
8.5	Optical Properties of Semiconductors	
8.6	Optical Dielectric Function	
8.7	Kramers–Kronig Relations	
8.8	Optical Properties of Composite Media	
8.9	Nonlinear Polarization	
8.10	Excitons	
8.11	Color Centers	
8.12	Polaritons	
8.13	Emissivity	
	References	
	Problems	
<b>W9</b>	<b>Magnetic Properties of Materials</b>	<b>75</b>
W9.1	Jahn–Teller Effect	75
W9.2	Examples of Weak and Strong Crystal Field Effects	75
W9.3	Crystal Fields and $\text{Cr}^{3+}$ in $\text{Al}_2\text{O}_3$	75
W9.4	Experimental Results for $\chi$ in the Free-Spin Limit	78
W9.5	Spin Glasses and the RKKY Interaction	79
W9.6	Kondo Effect and $s$ – $d$ Interaction	79
W9.7	$\chi(T)$ for Ni	80

W9.8 Hubbard Model	81
W9.9 Microscopic Origins of Magnetocrystalline Anisotropy	82
W9.10 $\chi_{\parallel}$ and $\chi_{\perp}$ for Antiferromagnetic Materials	82
W9.11 Magnetism in Disordered Materials	82
References	85
Problems	85
<i>Topics in the Textbook</i>	
9.1 Introduction	
Origins of Magnetism in Solids	
9.2 Free Atoms and Ions	
9.3 Atoms and Ions in Solids	
Types of Magnetism and Magnetic Behavior in Materials	
9.4 Paramagnetism	
9.5 Interactions Between Magnetic Moments	
9.6 Ferromagnetism	
9.7 Antiferromagnetism	
9.8 Ferrimagnetism	
9.9 Magnetic Behavior of Electrons in Closed Shells and of Conduction Electrons	
References	
Problems	
<b>W10 Mechanical Properties of Materials</b>	<b>87</b>
W10.1 Relationship of Hooke's Law to the Interatomic $U(r)$	87
W10.2 Zener Model for Anelasticity	89
W10.3 Typical Relaxation Times for Microscopic Processes	91
W10.4 Further Discussion of Work Hardening	92
W10.5 Strengthening Mechanisms	94
W10.6 Creep Testing	95
W10.7 Further Discussion of Fatigue	97
W10.8 Hardness Testing	98
W10.9 Further Discussion of Hall–Petch Relation	99
W10.10 Analysis of Crack Propagation	100
Reference	101
Problems	101
<i>Topics in the Textbook</i>	
10.1 Introduction	
Stress, Strain, and Elastic Constants	
10.2 Stress	
10.3 Strain	
10.4 Relationships Between Stress and Strain: Elastic Constants	
Elastic Properties of Materials	
10.5 Hooke's Law, Young's Modulus, and Shear Modulus	
10.6 Compressibility and Bulk Modulus	

10.7 Poisson's Ratio	
10.8 Isotropic Solids: Relationships Between the Elastic Moduli	
10.9 Elastic Potential Energy	
10.10 Elastic Waves	
Anelastic Properties of Materials	
10.11 Macroscopic Aspects of Anelasticity	
10.12 Microscopic Aspects of Anelasticity	
Inelastic Properties of Materials	
10.13 Macroscopic Aspects of Plasticity and Fracture	
10.14 Microscopic Aspects of Plasticity and Fracture	
References	
Problems	

### SECTION III CLASSES OF MATERIALS

<b>W11 Semiconductors</b>	<b>103</b>
W11.1 Details of the Calculation of $n(T)$ for an $n$ -Type Semiconductor	103
W11.2 Effects of Doping on Resistivity of Silicon	105
W11.3 Optical Absorption Edge of Silicon	105
W11.4 Thermoelectric Effects	106
W11.5 Dielectric Model for Bonding	110
W11.6 Nonstandard Semiconductors	112
W11.7 Further Discussion of Nonequilibrium Effects and Recombination	118
W11.8 Transistors	122
W11.9 Quantum Hall Effect	132
W11.10 Photovoltaic Solar Cells	137
W11.11 Thermoelectric Devices	140
Appendix W11A: Landau Levels	145
References	146
Problems	146

#### *Topics in the Textbook*

11.1 Introduction	
Characteristic Properties of Semiconductors	
Microscopic Properties	
11.2 Energy-Band Structure and Energy Gaps	
11.3 Dynamics of Electron Motion	
11.4 Excited States of Electrons	
11.5 Doping and Defects	
11.6 Dimensionality and Quantum Confinement	
Macroscopic Properties	
11.7 Electrical Conductivity and Mobility	
11.8 Effects of Magnetic Fields	
11.9 Optical Properties	

Examples of Semiconductors	
11.10 Elemental Semiconductors and Their Compounds and Alloys	
11.11 Compound Semiconductors and Their Alloys	
Applications of Semiconductors	
11.12 Critical Issues	
11.13 Specific Applications	
References	
Problems	

**W12 Metals and Alloys** **149**

W12.1 Density-Functional Theory	149
W12.2 Embedded-Atom Method	151
W12.3 Peierls Instability	153
W12.4 Corrosion and Oxidation	154
W12.5 Coatings	157
W12.6 Shape-Memory Alloys	159
W12.7 Metallic Glasses	162
W12.8 Metal Hydrides	164
W12.9 Solder Joints and Their Failure	165
W12.10 Porous Metals	166
References	167

*Topics in the Textbook*

12.1 Introduction	
Three Classes of Metals	
12.2 <i>sp</i> -Bonded Metals	
12.3 Transition Metals	
12.4 Rare Earth Metals	
Alloys	
12.5 Hume–Rothery Rules	
12.6 Electrical Resistance of Metallic Alloys	
Examples and Applications of Metallic Alloys	
12.7 Steel	
12.8 Intermetallic Compounds and Superalloys	
12.9 Electromigration	
References	
Problems	

**W13 Ceramics** **169**

W13.1 Ternary Phase Diagrams	169
W13.2 Silicates	174
W13.3 Clay	177
W13.4 Cement	179
Appendix W13A: Radius Ratios and Polyhedral Coordination	181
References	182
Problems	182

*Topics in the Textbook*

- 13.1 Introduction
- 13.2 Pauling Bonding Rules
- 13.3 Ionic Interactions

## Applications

- 13.4 Refractories
- 13.5 Silicon Nitride
- 13.6 Zeolites
- 13.7 Glasses

## References

## Problems

**W14 Polymers 183**

- W14.1 Structure of Ideal Linear Polymers 183
- W14.2 Self-Avoiding Walks 188
- W14.3 Persistence Length 189
- W14.4 Free-Volume Theory 191
- W14.5 Polymeric Foams 194
- W14.6 Porous Films 195
- W14.7 Electrical Conductivity of Polymers 196
- W14.8 Polymers as Nonlinear Optical Materials 200
- Problems 202

*Topics in the Textbook*

- 14.1 Introduction

## Structure of Polymers

- 14.2 Geometry of Polymers
- 14.3 Polymer Crystals
- 14.4 Defects in Polymers

## Mechanical Properties

- 14.5 Polymers Under Tension
- 14.6 Viscoelasticity

## Thermal Properties

- 14.7 Thermal Properties of Polymers

## Applications

- 14.8 Structural Plastics
- 14.9 Polymeric Ionic Conductors
- 14.10 Photoresists
- 14.11 Piezoelectric Polymers
- 14.12 Liquid Crystals

## References

## Problems

**W15 Dielectric and Ferroelectric Materials 203**

- W15.1 Capacitors 203

W15.2 Substrates	205
W15.3 First-Order Ferroelectric Phase Transitions	206
W15.4 Nonvolatile Ferroelectric Random-Access Memory	208
W15.5 Quartz Crystal Oscillator	210
W15.6 Lithium-Ion Battery	212
W15.7 Fuel Cells	214
References	216
Problem	217

*Topics in the Textbook*

- 15.1 Introduction
- 15.2 Lorentz Oscillator Model for the Dielectric Function
- 15.3 Dielectric Properties of Ionic Crystals
- 15.4 Dielectric Breakdown

Applications

- 15.5 Ferroelectric Phase Transitions
- 15.6 Ferroelectricity and Piezoelectricity
- 15.7 Thermistors
- 15.8 Varistors
- 15.9  $\beta$ -Aluminas and Ionic Transport in Solids

References

Problems

**W16 Superconductors** **219**

W16.1 Further Discussion of Thermal Conductivity in Superconductors	219
W16.2 Two-Fluid Model	219
W16.3 Superconducting Alloys of Metallic Elements	221
W16.4 Superconducting Intermetallic Compounds	221
W16.5 Further Discussion of Structure, Bonding, Composition, and Normal-State Properties of the Oxide-Based Ceramic Superconductors	223
W16.6 Further Discussion of Superconducting-State Properties of the Oxide-Based Ceramic Superconductors	232
W16.7 Unusual Superconductors	233
W16.8 Further Discussion of Critical Currents	235
W16.9 Further Discussion of Large-Scale Applications	239
W16.10 Josephson Effects	242
W16.11 SQUIDS and Other Small-Scale Applications	245
Reference	248
Problems	248

*Topics in the Textbook*

- 16.1 Introduction

Characteristic Properties of Superconductors

- 16.2 Macroscopic Properties and Models
- 16.3 Microscopic Properties and Models

Examples of Superconductors	
16.4 Metallic Elements	
16.5 Oxide-Based Ceramics	
Applications of Superconductors	
16.6 Critical Issues	
16.7 Specific Applications	
References	
Problems	

<b>W17 Magnetic Materials</b>	<b>251</b>
W17.1 Details on Domain Structures	251
W17.2 Details on Size and Shape Effects	252
W17.3 Details on Magnetostriction	253
W17.4 Giant and Colossal Magnetoresistance	255
W17.5 Faraday and Kerr Effects	257
W17.6 Details on Dynamic Magnetic Effects	260
W17.7 Technologically Important Magnetic Materials	264
W17.8 Details on Permanent-Magnet Materials	264
W17.9 Details on Magnetic Recording Materials	272
W17.10 Details on Magneto-Optical Recording Materials	277
W17.11 Details on Fe Alloys and Electrical Steels	278
W17.12 Details on Materials for Read/Write Heads	281
W17.13 Details on Magnetostrictive Materials	282
W17.14 Dilute Magnetic Semiconductors	284
References	285
Problems	285

*Topics in the Textbook*

17.1 Introduction	
Characteristic Properties of Magnetic Materials	
17.2 Magnetic Microstructure and Domains	
17.3 Magnetization Processes and Magnetization Curves	
17.4 Magnetically Hard and Soft Materials	
17.5 Effects of Magnetic Anisotropy	
17.6 Effects of Shape and Size	
Important Effects in Magnetic Materials	
17.7 Magnetostriction	
17.8 Magnetoresistance	
17.9 Magneto-Optical Effects	
17.10 Dynamic Magnetic Effects	
Examples and Applications of Magnetic Materials	
17.11 Hard Magnetic Materials	
17.12 Soft Magnetic Materials	
References	
Problems	

<b>W18 Optical Materials</b>	<b>287</b>
W18.1 Optical Polarizers	287
W18.2 Faraday Rotation	290
W18.3 Theory of Optical Band Structure	293
W18.4 Damage	296
References	297
Problem	297
<i>Topics in the Textbook</i>	
18.1 Introduction	
Propagation of Light	
18.2 Optical Fibers	
Generation of Light	
18.3 Lasers	
18.4 Light-Emitting Diodes and Semiconductor Lasers	
18.5 Ceramics for Lasers	
18.6 Bandgap Engineering of Optical Materials	
Recording of Light	
18.7 Photography	
18.8 Photoconductors and Xerography	
18.9 Electro-optic Effect and Photorefractive Materials	
References	
Problems	

## SECTION IV SURFACES, THIN FILMS, INTERFACES, AND MULTILAYERS

<b>19 Surfaces</b>	<b>299</b>
W19.1 Surface States	299
W19.2 Surfactants	301
W19.3 Adsorption	302
W19.4 Desorption	304
W19.5 Surface Diffusion	306
W19.6 Catalysis	308
W19.7 Friction	310
Appendix W19A: Construction of the Surface Net	311
Appendix W19B: Fowler–Nordheim Formula	314
Appendix W19C: Photoemission Yields	317
<i>Topics in the Textbook</i>	
19.1 Introduction	
19.2 Ideal Surfaces	
Real Surfaces	
19.3 Relaxation	
19.4 Reconstruction	

19.5 Surface Defects	
Electronic Properties of Surfaces	
19.6 Work Function	
19.7 Thermionic Emission	
19.8 Field Emission	
19.9 Photoemission	
19.10 Surface States	
Surface Modification	
19.11 Anodization	
19.12 Passivation	
19.13 Surface Phonons	
19.14 Surface Processes	
Adhesion and Friction	
19.15 Surface Plasmons	
19.16 Dispersion Forces	
19.17 Friction	
References	
Problems	
<b>W20 Thin Films, Interfaces, and Multilayers</b>	<b>321</b>
W20.1 Strength and Toughness	321
W20.2 Critical Thickness	322
W20.3 Ionic Solutions	324
W20.4 Solid–Electrolyte Interface	326
W20.5 Multilayer Materials	329
W20.6 Second-Harmonic Generation in Phase-Matched Multilayers	330
W20.7 Organic Light-Emitting Diodes	331
W20.8 Quasiperiodic Nonlinear Optical Crystals	332
W20.9 Graphite Intercalated Compounds	333
References	335
Problem	336
<i>Topics in the Textbook</i>	
20.1 Introduction	
Thin Films	
20.2 Surface Tension	
20.3 Thin-Film Fabrication	
20.4 Morphology Maps	
20.5 Langmuir–Blodgett Films	
Interfaces	
20.6 Grain Boundaries	
20.7 Band Bending in Semiconductors	
20.8 Schottky Barrier	
20.9 Semiconductor–Heterostructure Superlattices	
20.10 Quantum Dot	
20.11 Si/a-SiO <sub>2</sub> Interface	

Multilayers

- 20.12 X-ray Mirrors
- 20.13 Hardness of Multilayers
- 20.14 Stoichiometric Optimization of Physical Parameters

References

Problems

**SECTION V SYNTHESIS AND PROCESSING OF MATERIALS**

**W21 Synthesis and Processing of Materials 337**

W21.1 Synthesis and Processing Procedures	337
W21.2 Heteroepitaxial Growth	337
W21.3 Processing Using Ion Beams	344
W21.4 Float-Zone Purification of Single-Crystal Si	348
W21.5 Epitaxial Growth of Single-Crystal Si Layers via CVD	351
W21.6 Molecular-Beam Epitaxial Growth of GaAs	356

## **PREFACE**

---

As science has become more interdisciplinary and impinges ever more heavily on technology, we have been led to the conclusion that there is a great need now for a textbook that emphasizes the physical and chemical origins of the properties of solids while at the same time focusing on the technologically important materials that are being developed and used by scientists and engineers. A panel of physicists, chemists, and materials scientists who participated in the NSF Undergraduate Curriculum Workshop in Materials in 1989, which addressed educational needs and opportunities in the area of materials research and technology, issued a report that indicated clearly the need for advanced textbooks in materials beyond the introductory level. Our textbook is meant to address this need.

This textbook is designed to serve courses that provide engineering and science majors with their first in-depth introduction to the properties and applications of a wide range of materials. This ordinarily occurs at the advanced undergraduate level but can also occur at the graduate level. The philosophy of our approach has been to define consistently the structure and properties of solids on the basis of the local chemical bonding and atomic order (or disorder!) present in the material. Our goal has been to bring the science of materials closer to technology than is done in most traditional textbooks on solid-state physics. We have stressed properties and their interpretation and have avoided the development of formalism for its own sake. We feel that the specialized mathematical techniques that can be applied to predict the properties of solids are better left for more advanced, graduate-level courses.

This textbook will be appropriate for use in the advanced materials courses given in engineering departments. Such courses are widely taught at the junior/senior level with such titles as “Principles of Materials Science & Engineering,” “Physical Electronics,” “Electronics of Materials,” and “Engineering Materials.” This textbook is also designed to be appropriate for use by physics and chemistry majors. We note that a course in materials chemistry is a relatively new one in most chemistry undergraduate curricula but that an introductory course in solid-state physics has long been standard in physics undergraduate curricula.

To gain the most benefit from courses based on this textbook, students should have had at least one year each of introductory physics, chemistry, and calculus, along with a course in modern physics or physical chemistry. For optimal use of the textbook it would be helpful if the students have had courses in thermodynamics, electricity and magnetism, and an introduction to quantum mechanics.

As the title indicates, the range of topics covered in this textbook is quite broad. The 21 chapters are divided into five sections. The range of topics covered is comprehensive, but not exhaustive. For example, topics not covered in detail due to lack of space include biomaterials, a field with a bright future, and composites, examples of which are discussed only within specific classes of materials. Much more material is presented

than can be covered in a one-semester course. Actual usage of the text in courses will be discussed after the proposed subject matter has been outlined.

Following an introduction, which emphasizes the importance of materials in modern science and technology, Section I, on the “Structure of Materials,” consists of four chapters on the structure of crystals, bonding in solids, diffraction and the reciprocal lattice, and order and disorder in solids.

Section II, on the “Physical Properties of Materials,” consists of six chapters on phonons; thermally activated processes, phase diagrams, and phase transitions; electrons in solids; electrical and thermal properties; optical properties; magnetic properties; and mechanical properties.

Section III, titled “Classes of Materials,” consists of eight chapters on semiconductors; metals and alloys; ceramics; polymers; dielectric and ferroelectric materials; superconductors; magnetic materials; and optical materials. In each chapter the distinctive properties of each class of materials are discussed using technologically-important examples from each class. In addition, the structure and key properties of selected materials are highlighted. In this way an indication of the wide spectrum of materials in each class is presented.

Section IV, titled “Surfaces, Thin Films, Interfaces, and Multilayers,” consists of two chapters covering these important topics. Here the effects of spatial discontinuities in the physical and chemical structure on the properties of materials are presented, both from the point of view of creating materials with new properties and also of minimizing the potential materials problems associated with surfaces and interfaces.

Section V, titled “Synthesis and Processing of Materials,” consists of a single chapter. Representative examples of how the structure and properties of materials are determined by the techniques used to synthesize them are presented. “Atomic engineering” is stressed. The tuning of structure and properties using postsynthesis processing is also illustrated.

Problem sets are presented at the end of each chapter and are used to emphasize the most important concepts introduced, as well as to present further examples of important materials. Illustrations are employed for the purpose of presenting crystal structures and key properties of materials. Tables are used to summarize and contrast the properties of related groups of materials.

We have created a home page that provides a valuable supplement to the textbook by describing additional properties of materials, along with additional examples of current materials and their applications. Chapter W22 on our home page emphasizes the structural and chemical characterization of materials, as well as the characterization of their optical, electrical, and magnetic properties. As new materials and applications are developed, the home page will be regularly updated.

Since this text will likely be used most often in a one-semester course, we recommend that Chapters 1–4 on structure be covered in as much detail as needed, given the backgrounds of the students. A selection of chapters on the properties of materials (5–10) and on the classes of materials (11–18) of particular interest can then be covered. According to the tastes of the instructor and the needs of the students, some of the remaining chapters (surfaces; thin films, interfaces, and multilayers; synthesis and processing of materials) can be covered. For example, a course on engineering materials could consist of the following: Chapters 1–4 on structure; Chapter 6 on thermally activated processes, etc.; Chapter 10 on mechanical properties; Chapter 12 on metals and

alloys; Chapter 13 on ceramics; Chapter 14 on polymers; and Chapter 21 on synthesis and processing.

Physics majors usually take an introductory course in solid-state physics in their senior year. Therefore in such a course it will be necessary to start at “the beginning,” i.e., Chapter 1 on the structure of crystals. Students in MS&E or engineering departments who have already taken an introductory course on materials can quickly review (or skip) much of the basic material and focus on more advanced topics, beginning with Chapter 5 on phonons, if desired, or Chapter 7 on electrons in solids.

We owe a debt of gratitude to our colleagues at The City College and City University who, over the years, have shared with us their enthusiasm for and interest in the broad and fascinating subject of materials. They include R. R. Alfano, J. L. Birman, T. Boyer, F. Cadieu, H. Z. Cummins, H. Falk, A. Genack, M. E. Green, L. L. Isaacs, M. Lax, D. M. Lindsay (deceased), V. Petricevic, F. H. Pollak, S. R. Radel, M. P. Sarachik, D. Schmeltzer, S. Schwarz, J. Steiner, M. Tamargo, M. Tomkiewicz, and N. Tzoar (deceased). Colleagues outside CUNY who have shared their knowledge with us include Z. L. Akkerman, R. Dessau, H. Efstathiadis, B. Gersten, Y. Goldstein, P. Jacoby, L. Ley, K. G. Lynn, D. Rahoi, and Z. Yin. Our thanks also go to our students and postdocs who have challenged us, both in our research and teaching, to refine our thinking about materials and their behavior.

Special thanks are due to Gregory Franklin who served as our editor at John Wiley & Sons for the bulk of the preparation of this textbook. His unflagging support of this effort and his patience are deeply appreciated. Thanks are also due to our current editor, George Telecki, who has helped us with sound advice to bring this project to a successful conclusion. We acknowledge with gratitude the skill of Angioline Loreda who supervised the production of both the textbook and supplementary Web-based material. We have appreciated the useful comments of all the anonymous reviewers of our textbook and also wish to thank all the authors who granted permission for us to use their artwork.

Finally, we gratefully acknowledge the constant support, encouragement, and patience of our wives, Harriet and Françoise, and our families during the years in which this textbook was prepared. Little did we (or they) know how long it would take to accomplish our goals.

JOEL I. GERSTEN  
FREDERICK W. SMITH

## LIST OF TABLES

---

W2.1	Atomic orbitals	9
W2.2	Periodic table of valence electron configurations	10
W2.3	Hybrid orbitals	13
W2.4	Bond energies	20
W2.5	Valence, bonding, and crystal structures of oxides	22
W6.1	Vaporization results for Fe and Si	52
W8.1	Indices of refraction	70
W9.1	Mulliken symbols for crystal field representations	77
W9.2	Competing effects in metals: thermal, RKKY, and Kondo	80
W10.1	Typical relaxation times for microscopic processes	92
W11.1	Values of $E_h$ , $C$ , $E_g$ , and $f_i$ for several semiconductors	112
W11.2	Minority-carrier band-to-band radiative lifetimes	118
W11.3	Figures of merit for various semiconductors	122
W12.1	Embedding energy parameters	153
W12.2	Temperature data for shape-memory alloys	160
W13.1	The seven principal classes of silicates	176
W14.1	Self-avoiding walks on a cubic lattice	188
W15.1	Properties of relaxor dielectrics	204
W15.2	Properties of substrate materials	205
W15.3	Properties of electrolyte solvents	214
W15.4	Lithium-ion battery configurations	215
W16.1	Superconducting $T_c$ s and crystal structures of intermetallic compounds	223
W16.2	Critical current densities $J_c$ for superconductors	236
W17.1	Upper coercive field limits of small magnetic particles	252
W17.2	Technologically important magnetic materials	264
W17.3	Properties of permanent-magnet materials	266
W17.4	Magnetic properties of Fe, Fe alloys, and electrical steels	278
W17.5	Magnetic materials with giant magnetostrictions	282
W18.1	Verdet constants	292
W19.B.1	Asymptotic expansion of the Airy functions	316
W20.1	Standard redox potential energies	329
W21.1	Materials synthesis and processing procedures	338
W21.2	Sources of energy used in synthesis and processing	339
W21.3	Distribution coefficients of elements in Si near $T_m$	351
W21.4	Typical precursor gases used in PECVD	360
W21.5	Important phases of Fe, Fe compounds and alloys, and their multicomponent mixtures	375

**xxviii** LIST OF TABLES

W22.1	The five Bravais nets and their properties	422
W22.2	Auger transitions and their energies	465
W22.3	Spin 1/2 nuclei commonly used in NMR spectroscopy	486
W22.4	Nuclear spins, abundances, precession frequencies, and quadrupole moments	494
